A major responsibility of the U.S. Geological Survey (USGS) is to ensure geospatial data availability. This includes cooperative production of digital geospatial data through the National Mapping Program's Innovative Partnerships (IP) initiative, which began in October 1992.

The USGS recognizes the public benefit of obtaining digital data that State and local government agencies, academic institutions, public utilities, and private firms produce to support their own mapping needs. Incorporating digital products prepared by these organizations into the National Mapping Program reduces duplicative data collection and leverages funds in obtaining standardized digital map data for the public domain as part of the National Spatial Data Infrastructure (NSDI).

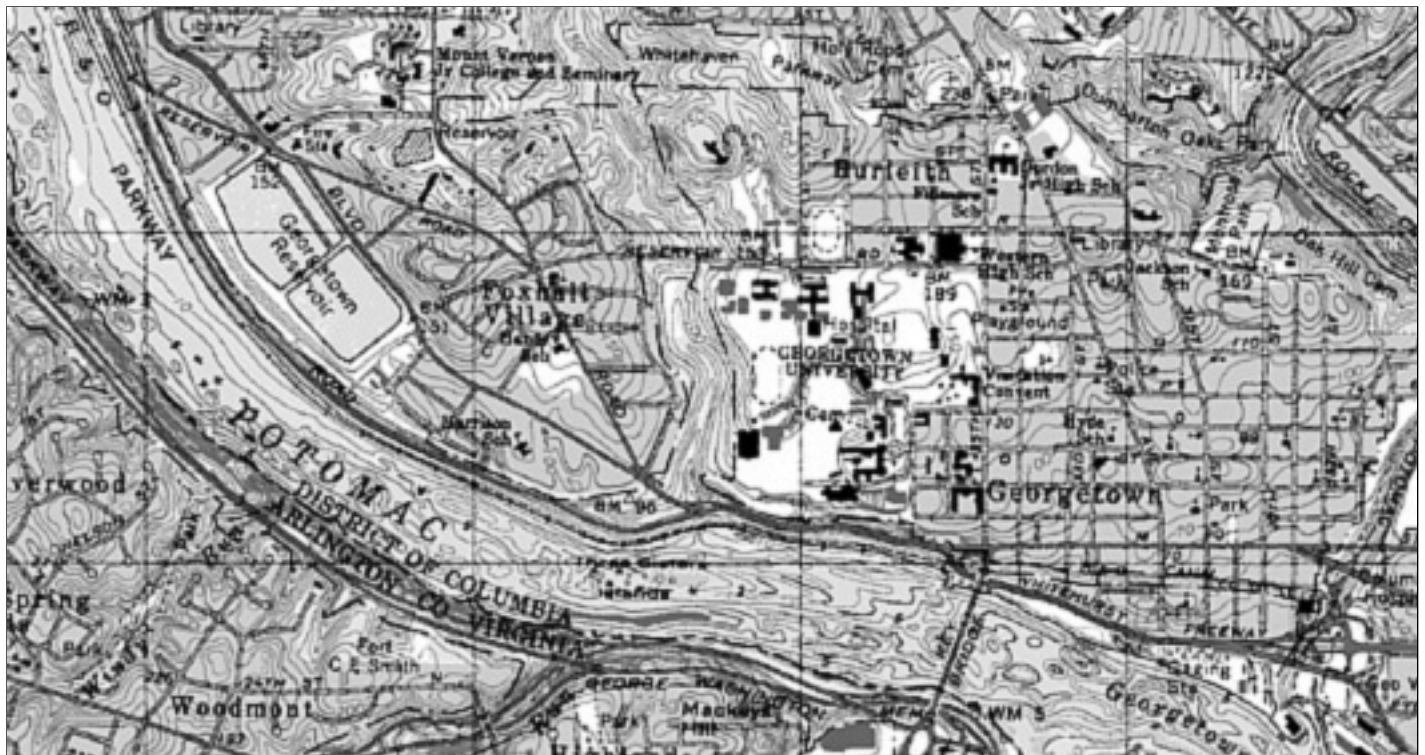

The general goal of IP's is to obtain digital elevation, vector line, orthoim-

age, and similar data, in USGS or compatible formats, for the public domain from non-Federal producers using Federal assistance. These data are obtained under cooperative agreements with qualified applicants identified through publicly advertised program announcements. Data are captured from or referenced to the USGS primary topographic series maps and meet requirements for accuracy, resolution, source suitability, file extent, and format. The primary series includes 1:24,000-scale quadrangle maps of the conterminous United States and Hawaii and 1:63,360-scale maps of Alaska. IP's accelerate the building of public-domain geospatial databases, provide data to support resource management and geographic information system requirements, support NSDI activities using framework and clearinghouse concepts, address congressional directives concerning commercialization, and increase the

amount of geospatial data available to support the National Mapping Program. In addition, they take advantage of opportunities to build Federal and non-Federal mapping partnerships at favorable cost, minimize duplication of effort in geospatial data collection, and evaluate alternative production methods and data transfer procedures.

Federal assistance may be monetary or nonmonetary. Nonmonetary assistance may take the form of government-furnished materials, services, training, or software. Data processing costs incurred by the USGS to bring the data to the national standard may reduce assistance.

Overall, the IP program is limited by available funding. Awards are made to applicants offering the greatest program and technical benefits at a fair and reasonable price. The USGS may support some, all, or none of the

proposals received and may limit the amount of work to be performed or data to be obtained through IP cooperative agreements. Support for future years of multiyear agreements is contingent on a recipient's successful completion of work during the initial period of performance and on continued availability of USGS funds. If funding is not available for an otherwise acceptable proposal, the USGS may, with the applicant's concurrence, hold it for award when funding becomes available.

## Information

For further information, contact:

John Szemraj, IP Coordinator  
U.S. Geological Survey

USGS Program Announcement 8080 for Innovative Partnerships, entitled "Assistance for Preparing Primary Series Digital Cartographic Data for the Public Domain," is in effect until July 31, 2000. A digital copy can be obtained from the Internet at:

[ftp://mapping.usgs.gov/pub/dpi/innov\\_part/PA\\_8080.wp5](ftp://mapping.usgs.gov/pub/dpi/innov_part/PA_8080.wp5)

This, however, does not include printed forms. For a complete printed program announcement, fax a request to Tammy Fanning, USGS Contracting Officer, at 703-648-7363. Technical information regarding the various digital data formats is available on the Internet at:

<ftp://mapping.usgs.gov/pub/ti/>
